

# DaaS Concerns Design

---

The goal of this assignment is to analyze and perform a conceptual design for accessing DaaS concerns. From the DaaS that you selected in the first assignment, you should

- Decide a subset of DaaS concerns that you think are important for that DaaS and explain your decision
- Design/select a representation that can be used to describe these selected DaaS concerns
- Provide a conceptual design of some APIs for accessing DaaS concerns (and with which resources these concerns are associated)

You do not need to implement them but your conceptual design would allow us to query/check the selected data concerns for data resources/items within the selected DaaS.

The report should be limited to 2 pages in IEEE computer society format template (<http://www.computer.org/portal/web/cscps/formatting>).

The report should be submitted by **Friday 25.04.2014** to [truong@dsg.tuwien.ac.at](mailto:truong@dsg.tuwien.ac.at).
